The formation of self-assemblies from pre-micellar surfactant species. The adsorption of amphiphilic surfactant molecules at the bubble interface is not the only important phenomenon occurring during foam formation. Another extremely important process also occurs in bulk solution at high surfactant concentrations.

The second method involves artificially producing gas bubbles by physical methods (e.g. by nucleation or electrolysis) or

chemical methods, which are commonly exploited in the production of polymer foams and involve the use of so-called blowing agents. These are chemical compounds that decompose or react to produce gas bubbles.
