An old-style film camera is sometimes referred to as an example of analog technology. You capture an image on a piece of transparent plastic "film" coated with silver-based chemicals, which react to light. When the film is developed (chemically processed in a lab), it's used to print a representation of the scene you photographed.

Just like physical film and analog video, a digital video stream is made up of individual frames, each one representing a time slice of the scene. Films display 24 frames per second, and American video presents 30 frames in that same time span, known as the frame rate. The higher the number of frames in any given second, the smoother the video will appear.

To accomplish these two goals, digital recording converts the analog wave into a stream of numbers and records the numbers instead of the wave. The conversion is done by a device called an analog-to-digital converter (ADC). To play back the music, the stream of numbers is converted back to an analog wave by a digital-to-analog converter (DAC).

Analog television is the original television technology that uses analog signals to transmit video and audio. In an analog television broadcast, the brightness, colors and sound are represented by amplitude, phase and frequency of an analog signal. Analog signals vary over a continuous range of possible values which means that electronic noise and interference may be introduced. Thus with analog, a moderately weak signal becomes snowy and subject to interference. In contrast, picture quality fro
