PostgreSQL: Documentation: 8.4: INSERT

PostgreSQL™ provides two distinct ways to store binary data. Binary data can be stored in a table using the data type bytea or by using the Large Object feature which stores the binary data in a separate table in a special format and refers to that table by storing a value of type oid in your table.. In order to determine which method is appropriate you need to understand the limitations of ...

Configuring the PostgreSQL™ server for SSL is covered in the main documentation, so it will not be repeated here. Before trying to access your SSL enabled server from Java, make sure you can get to it via psql. You should see output like the following if you have established a SSL connection. \$./bin/psql -h localhost Welcome to psql 8.0.0rc5, the PostgreSQL interactive terminal.

By default the driver collects all the results for the query at once. This can be inconvenient for large data sets so the JDBC driver provides a means of basing a ResultSet on a database cursor and only fetching a small number of rows.. A small number of rows are cached on the client side of the connection and when exhausted the next block of rows is retrieved by repositioning the cursor.

Outputs. On successful completion, an `INSERT` command returns a command tag of the form. `INSERT oid count`. The count is the number of rows inserted. If count is exactly one, and the target table has OIDs, then oid is the OID assigned to the inserted row. Otherwise oid is zero. If the `INSERT` command contains a `RETURNING` clause, the result will be

similar to that of a SELECT statement containing ...
